Again, as with multi-media, vendors have worked hard to provide solutions for thin client devices.. 6: Local Device Access As with multi-media, thin client devices have a reputation for poor support for local device access – historically because the centralised services did not readily support connecting local devices reliably from the end device.. Your own disk resource, dedicated CPU and memory – a boon when mainframe time was expensive and installations were few – has become a support imposition; costly to power, a target for thieves, and ultimately expensive to maintain..
